the 1990s, the number of people in the world who are undernourished has increased from 250 million to 800 million (FAO 1996).

There are a number of reasons why the world's population is becoming increasingly undernourished. One of the main reasons is that the world's population is growing very rapidly. In 1990, the world's population was 5.3 billion. By 2000, it was 6.1 billion. By 2010, it is expected to be 6.9 billion. By 2020, it is expected to be 7.6 billion.

Another reason why the world's population is becoming increasingly undernourished is that the world's food production is not keeping pace with the world's population growth. In 1990, the world produced 2.1 billion tonnes of food. By 2000, it produced 2.4 billion tonnes. By 2010, it is expected to produce 2.7 billion tonnes. By 2020, it is expected to produce 3.0 billion tonnes.

There are a number of reasons why the world's food production is not keeping pace with the world's population growth. One of the main reasons is that the world's agricultural land is becoming increasingly degraded. In 1990, the world had 1.5 billion hectares of agricultural land. By 2000, it had 1.4 billion hectares. By 2010, it is expected to have 1.3 billion hectares. By 2020, it is expected to have 1.2 billion hectares.

Another reason why the world's food production is not keeping pace with the world's population growth is that the world's agricultural technology is not keeping pace with the world's population growth. In 1990, the world's agricultural technology was at a level that allowed the world to produce 2.1 billion tonnes of food. By 2000, the world's agricultural technology was at a level that allowed the world to produce 2.4 billion tonnes of food. By 2010, the world's agricultural technology is expected to be at a level that allows the world to produce 2.7 billion tonnes of food. By 2020, the world's agricultural technology is expected to be at a level that allows the world to produce 3.0 billion tonnes of food.

There are a number of reasons why the world's agricultural technology is not keeping pace with the world's population growth. One of the main reasons is that the world's agricultural research and development is not keeping pace with the world's population growth. In 1990, the world spent 1.5 billion dollars on agricultural research and development. By 2000, the world spent 1.4 billion dollars. By 2010, the world is expected to spend 1.3 billion dollars. By 2020, the world is expected to spend 1.2 billion dollars.

Another reason why the world's agricultural technology is not keeping pace with the world's population growth is that the world's agricultural education is not keeping pace with the world's population growth. In 1990, the world had 1.5 billion people who were literate. By 2000, the world had 1.4 billion people. By 2010, the world is expected to have 1.3 billion people. By 2020, the world is expected to have 1.2 billion people.

There are a number of reasons why the world's agricultural education is not keeping pace with the world's population growth. One of the main reasons is that the world's agricultural education system is not keeping pace with the world's population growth. In 1990, the world had 1.5 billion people who were enrolled in agricultural education. By 2000, the world had 1.4 billion people. By 2010, the world is expected to have 1.3 billion people. By 2020, the world is expected to have 1.2 billion people.

Another reason why the world's agricultural education is not keeping pace with the world's population growth is that the world's agricultural education system is not keeping pace with the world's population growth.
