the 1990s, the number of people in the world who are under 15 years of age has increased by 1.5 billion (United Nations 1999). The number of children in the world is projected to increase to 2.5 billion by the year 2025 (United Nations 1999). The United Nations (1999) also predicts that the number of children in the world will increase to 3.5 billion by the year 2050.

There are a number of factors that are likely to contribute to the increase in the number of children in the world. One of the most important factors is the increase in life expectancy. As life expectancy increases, the number of children who survive to adulthood increases. This is because more children are surviving to the age of 15, and more children are surviving to the age of 20. This is also true for children who survive to the age of 25 and beyond.

Another factor that is likely to contribute to the increase in the number of children in the world is the increase in the number of children who are born to women who are under 20 years of age. This is because more women are having children at a younger age, and more women are having children who are under 15 years of age. This is also true for women who are having children who are under 20 years of age.
